

0.a. Goal

Objective 12. Establish sustainable consumption and production patterns

0.b. Target

12.2 By 2030, achieve sustainable management and rational use of natural resources

0.c. Indicator

12.2.2. Total fertility rate

0.e. Metadata update

5/1/2020 12:00:00 AM

1.a. Organisation

Burundi Institute of Statistics and Economic Studies (ISTEEBU)

1.b. Contact person(s)

NDAYISENGA Modest

1.c. Contact organisation unit

Social studies and statistics and poverty monitoring (ESSSP)

1.d. Contact person function

ESSSP department manager

1.e. Contact phone

(+257) 79401937

1.f. Contact mail

1156 BUJUMBURA

1.g. Contact email

ndayimode2010@gmail.com;

2.a. Definition and concepts

The total fertility rate measures the number of children a woman would have, during her fertile life, if she behaved in accordance with the fertility-by-age observed in a given year. It is obtained by adding the average number of births per woman in all the years defined as fertile (from 15 to 49 years)

2.b. Unit of measure

Number

3.a. Data sources

Household surveys

3.b. Data collection method

Data are collected from household surveys using the "household" questionnaire

3.c. Data collection calendar

The probable date of the next collection will be 2021 (Next DHS)

3.d. Data release calendar

In 2022

3.e. Data providers

ISTEEBU

3.f. Data compilers

ISTEEBU is responsible for compiling this indicator at the national level

3.g. Institutional mandate

ISTEEBU is the body recognized by the Burundian government for the collection, processing and dissemination of official statistics helping in planning and decision-making.

4.a. Rationale

The total fertility rate is relevant because it measures the number of children a woman would have, during her fertile life, if she behaved in accordance with the fertility by age observed in a given year. It is obtained by adding the average number of births per woman in all the years defined as fertile (from 15 to 49 years)

4.b. Comment and limitations

Updating the indicator requires a household survey which is very resource intensive. The indicator cannot be calculated by gender.

4.c. Method of computation

It is obtained by adding the average number of births per woman in all the years defined as fertile (from 15 to 49 years)

4.d. Validation

The results of the survey are validated at two levels: technical validation and official validation before publication

5. Data availability and disaggregation

The indicator is available at national level, province, area of residence (National; Urban area; Rural area)

6. Comparability/deviation from international standards

The indicator can be compared to other indicators of the same type at regional and international level
